

ABSTRACT OF THE DISCLOSURE

An image printer system that prints out images using image data taken by a digital camera and recorded in a recording medium and that saves the image data in the recording medium in another recording medium. In this system, parameters are set for the printing operation and for the saving operation before they are begun, and the two operations are performed simultaneously or in one sequence. The image data may be corrected for the printing, but the image data that is saved is the original image data.
